## Send Grid Integration with python code

- Create an account

After entering the website, click on the [start for free button](https://signup.sendgrid.com/) HYPERLINK "https://signup.sendgrid.com/" and you will be redirected to the following page. Enter the email and password to create an account.

## Let's Get Started

Sign up for free. No credit card required.

Email Address •

☒ Use email address as username

Password •

Must have at least 16 characters.

I'm not a robot

reCAPTCHA  
Privacy - Terms

☐ I accept the [Terms of Service](#) and have read the [Services Privacy Policy](#)

Create Account

account creation page

- Create an API key

After we have successfully created our account, the next step is to create an API key so that we can use it in our python code to communicate with our account.

## API Keys

[Create API Key](#)

NAME	API KEY	ACTION
email <del>APIKey is: 7f00nPCURW0002_00gng</del>	 .....	 

API keys list

- Email verification

The next thing we have to do is to verify our email which we will be using to send emails. We can verify our email in two ways, either by single sender verification or domain verification.

**Coding:** import os

from sendgrid import

SendGridAPIClient

from

sendgrid.helpers.mail

import Mail

message = Mail(

from\_email="[verified\\_email](#)

[l@gmail.com](#)",

to\_emails="[receiver@gmail](#)

[il.com](#)", subject="test",

html\_content="<p>hi</hi

>"

```
)
```

try:

```
    sg = SendGridAPIClient("XXXXX  
API key XXXXXX") response =  
sg.send(message) except Exc  
epti on as e: prin  
t(e)
```

The code example

Let us create a simple program in python to send an email. First, we have to install the SendGrid Python library. You can easily install it using pip by running the following command in your terminal.

```
$ pip install sendgrid
```

Once the package is installed, we can send emails using SendGrid. I have added a python code example below.

Conclusion

Hope this article is helpful. In addition to python, they also support other programming languages right out of the box.

Sample code :

```
import os from  
sendgrid import  
SendGridAPIClient  
from  
sendgrid.helpers.mail  
import Mail
```

```

message = Mail(
    from_email='from_email@example.com',
    to_emails='to@example.com',
    subject='Sending with Twilio SendGrid is Fun',
    html_content='<strong>and easy to do anywhere, even with Python</strong>') try:
    sg =
    SendGridAPIClient(os.environ.get('SENDGRID_API_KEY')) response = sg.send(message)
    print(response.status_code)
    print(response.body)
    print(response.headers)
except Exception as e: print(e, message)

```
